1. INTRODUCTION

1.1 Project Overview

Agriculture forms the basis for food security and hence it is important. In India, majority of the population i.e., above 55% is dependent on agriculture as per the recent information. Agriculture is the field that enables the farmers to grow ideal crops in accordance with the environmental balance. Farmers also grow non-food items like rubber, cotton, jute etc. More than 70% of the household in the rural area depend on agriculture. This domain provides employment to more than 60% of the total population and has a contribution to GDP also (about 17%). In the farm output, India ranks second considering the world wide scenario. This is the widest economic sector and has an important role regarding the framework of socio-economic fabric of India. Farming depends on various factors like climate and economic factors like temperature, irrigation, cultivation, soil, rain fall, pesticide and fertilizers. Historical information regarding crop yield provides major input for companies engaged in this domain. These companies make use of agriculture products as raw materials, animal feed, paper production and so on. The estimation of production of crop helps these companies in planning supply chain decision like production scheduling. The industries such as fertilizers, seed, agrochemicals and agricultural machinery plan production and activities like marketing based on the estimates of crop yield. Farmers experience was the only way for prediction of crop yield in the past days. Technology penetration into agriculture field has led to automation of the activities like yield estimation, crop health monitoring etc.

Achieving maximum crop yield at minimum cost is one of the goals of agricultural production. Early detection and management of problems associated

with crop yield indicators can help increase yield and subsequent profit. Additionally, these predictions could be used to maximize crop prediction when potential exists for favorable growing conditions.

Crop yield prediction helps the farmers in various ways by providing the record of previous crop yield. Knowing what crops have been grown, and how much area of it had been shown historically, combined with the prices.

This project works on achieving the more quality of the crop that will help the farmers to gain more money. In this project we have collected the datasets of all the factors that are dependent of the crops of several years. Using this data the prediction is obtained to show that the harvest of the crop that is growth in that region.

1.2 Purpose

It has been observed that farmers are facing the problem at the time of the yield of the crop because of the rapid changes in the weather where it affects the yield of the crop. Decrease the quality of the crop and which in turn provides less income to the farmers. This project works on achieving the more quality of the crop that will help the farmers to gain more money. In this project we have collected the datasets of all the factors that are dependent of the crops of several years. Using this data the prediction is obtained to show that the harvest of the crop that is growth in that region.

2. LITERATURE SURVEY

2.1 Existing Problem

A research group conducted a work with an objective of accurate prediction of crop yield through big data analytics to assess various crop yield influencing

factors such as Area under Cultivation (AUC) in terms of hectares, Annual Rainfall (AR) rates and Food Price Index (FPI) and to develop relationship among these parameters. Regression Analysis (RA) methodology was applied to examine the selected factors and their impact on crop prediction and final yield. RA methodology is a multivariable investigation practice which can categorize the factors into groups such as explanatory and response variables and helps to assess their interaction to obtain a resolution. All the selected factors of the present study design known as AR, AUC and FPI were measured for a period of 10 years between the years 1990-2000. A novel method called Linear Regression (LR) is applied to analyze the relationship between explanatory variables (AR, AUC, FPI) and the crop yield considered as response variable. Study reported that the R^2 value for the studied factors clearly indicate that crop yield is principally depends on AR. Study also reported that the other two factors (AUC and FPI) screened were also found to have significant impact after the AR. Study shall be continued to analyze the impact of for other substantial factors like Minimum Support Price (MSP), Cost Price Index (CPI), Wholesale Price Index (WPI) etc. and their relationship on the yields of different crops.

2.3 Problem Statement Definition

India is an agricultural country. Yield of each crop depends on its dependent factors. It is very important to predict the yield of a crop to help farmers. Crop Yield Prediction is predicting the yield of a crop in future based on the dependent factors. Crop yield is dependent on factors like rainfall, pressure, temperature and area or the geographical location. This is achieved by

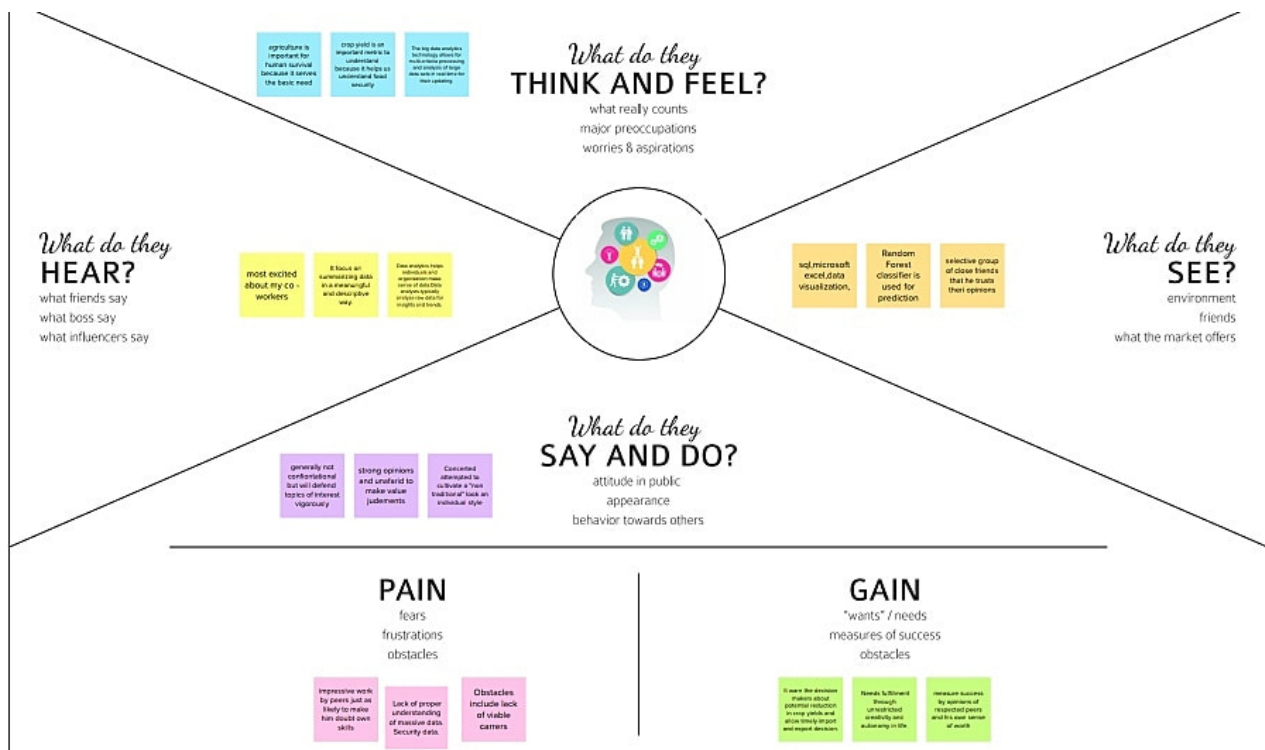

(a) Designing a system to estimate crop yield.

(b) Providing graphical user interface to view estimation result and historical datasets.

3. IDEATION AND PROPOSED SOLUTION

3.1 Empathy Map Canvas

3.2 Ideation and Brainstorming

1

Define your problem statement

How might we

 **5 minutes**

PROBLEM

Crop yield prediction is one of the importance factors in agriculture practices. The use of technology in agriculture has increased in recent years and data analytics is one such trend that has penetrated into agricultural field. The main challenge in using big data in agriculture is identification of effectiveness of big data analytics.

Key rules of brainstorming

2

Brainstorm

Write down any ideas that come to mind that address your problem statement.

 10 minutes

TIP

You can select a sticky note and hit the pencil [switch to sketch] icon to start drawing!

Gokila R

| | | |
|--|---|--|
| Big data provides farmers granular data on rainfall, patterns, water cycles etc. | Long short-term memory and convolutional neural networks are widely used approaches | Creating in the way to help government in farming policies. |
| Using data analytics, both supervised and un supervised learnings are used. | Also calculate and improve production of crop yield regularly. | |
| | Using large dataset to analyse more. | Try to satisfy all expectations with minimum cost with efficient algorithm |

Jeevadharshini B

| | | |
|---|---|--|
| account for the variability of climate, soil and farming conditions | account for a wide range of soil and farming | can be applied at local-regional and global scales for time scales extending from hours to decades |
| In order to budget and plan for the coming season | optimise the requirement of fertiliser water and added irrigation and increase yields | The pest infestation is minimized |
| decreases soil strength resulting in deeper and denser | | |

3.3 Proposed Solution

| S.No | Parameter | Description |
|------|--|---|
| 1 | Problem Statement (Problem to be solved) | Crop yield prediction is predicting the yield of a crop in future based on the dependent factors. Crop yield is dependent on factors like weather. This is achieved by (a) Designing a system to predict yield. (b) Providing graphical user interface to view(estimate) predict results. |
| 2 | Idea / Solution description | To predict the yield, one of the machine learning algorithms called Multiple Linear Regression algorithm is used. The result of prediction is plotted via graph. |
| 3 | Novelty / Uniqueness | By using of data analytics in crop yield estimation helps in analysing some important visualization, creating dashboard and by going through these we will get most of the insights of crop production in India. |
| 4 | Social Impact / Customer Satisfaction | Customer(farmer) can satisfied by increased income, reduced crop loss and high yield. |
| 5 | Business Model (Revenue Model) | Initially an raw data set was collected and subjected to analysis. From the dataset, it is subjected to |

| | | |
|---|-----------------------------|---|
| | | feature selection for make a predictive modelling. Final representation represents the graphical result which is helpful for analysis or estimation of crops in specified rainfall. |
| 6 | Scalability of the Solution | Effectively analysis large dataset. Easy to predict by using previous data. |

3.4 Problem Solution Fit

| | | | | |
|------------------------|---|---|--|----------------------------------|
| Define CS, fit into CC | 1. CUSTOMER SEGMENT(S) Who is your customer? Farmer | 6. CUSTOMER CONSTRAINTS What constraints prevent your customers from taking action or limit their choices of solutions? Production constraints have been identified that contribute to explaining the yield gap, for example limited water availability, limited nutrient availability, inadequate crop protection, insufficient or inadequate | 5. AVAILABLE SOLUTIONS Which solutions are available to the customers when they face the problem or need to get the job done? What have they tried in the past? What pros & cons do these solutions have? Rising meet demand for more food of higher quality. Invest in farm productivity. Adopt and learn new technologies. Stay resilient against global economic factors. Data stored can help the other farmer's in future to check the harvest of the crop | Explore AS, differenti |
| | 2. JOBS-TO-BE-DONE / PROBLEMS Gives insights on various data analytics methods applied to crop yield prediction and also signifies the crop estimation. | 9. PROBLEM ROOT CAUSE What is the real reason that this problem exists? What is the back story behind the need to do this job? Can't predict whether condition. It's leads to wastage of money | 7. BEHAVIOUR What does your customer do to address the problem and get the job done? To increase income. Reduce crop loss. High yield | |
| Ident | 3. TRIGGERS What triggers customers to act? As the food is the basic need of humans, the requirement of getting the maximum yields using optimal resource will become the necessity in near future as a result of growing population | 10. YOUR SOLUTION If you are working on an existing business, write down your current solution first, fill in the canvas, and check how much it fits reality. His project solves one of the fundamental problems that the Indian farmers are facing that is selection of which type of crop will yield | 8. CHANNELS of BEHAVIOUR 8.1 ONLINE What kind of actions do customers take online? Extract online channels from #7 Customers can store their data in cloud storage which can be easily accessed through internet. 8.2 OFFLINE | Focus on J&P, tap into BE, under |
| | | | | |

Identify

| | | | |
|--------------------|---|--|--|
| SYSTEM CONSTRAINTS | 4. EMOTIONS: BEFORE / AFTER How do customers feel when they face a problem or a job and afterwards? Before: Due to variations in climatic conditions, there exist bottlenecks for increasing the crop production. This may leads to less income for farmers. It also destroy various crops due to climatic changes. After: As a result of penetration of technology into agriculture field, there is a marginal improvement in the productivity. The innovations have led to new concepts like digital agriculture, smart farming, precision agriculture etc. It is used by the farmers for predicting weather and to estimate the crop yields. It may useful to increase the crop yields and reduce crop loss. | the maximum results. The sole objective is to increase farmer's income. Lack of proper dataset is the major hurdle while predicting the name of the crops but we were able to manage that by merging different data sets | What kind of actions do customers take offline? Extract offline channels from #7 And use them for customer development Through online farmers can predict the crop yields and estimate the yields easily. Through offline the different dataset can be collected to predict previous year information and yields. |
| | | | |

4 REQUIREMENT ANALYSIS

4.1 Functional Requirement

| FR No | Functional Requirement (Epic) | Sub Requirement(Story/SubTask) |
|-------|--------------------------------|---|
| FR-1 | User login | Login through internet or app |
| FR-2 | Login through internet or app | User can update their profile with name, mobile number and password |
| FR-3 | Analyse the dataset | Analyse the dataset and process data preprocessing to avoid noise data. |
| FR-4 | Choose the crop | Through which the user can choose particular crop for their convenience. |
| FR-5 | Predict result | The result will be predicted based on the previous year data in the way of production per hectare for particular rainfall measure in that area. |
| FR-6 | Estimation of the result | The graphical representation shown the estimation analysis of the crop to increase more yield. |

4.2 Non-Functional Requirements

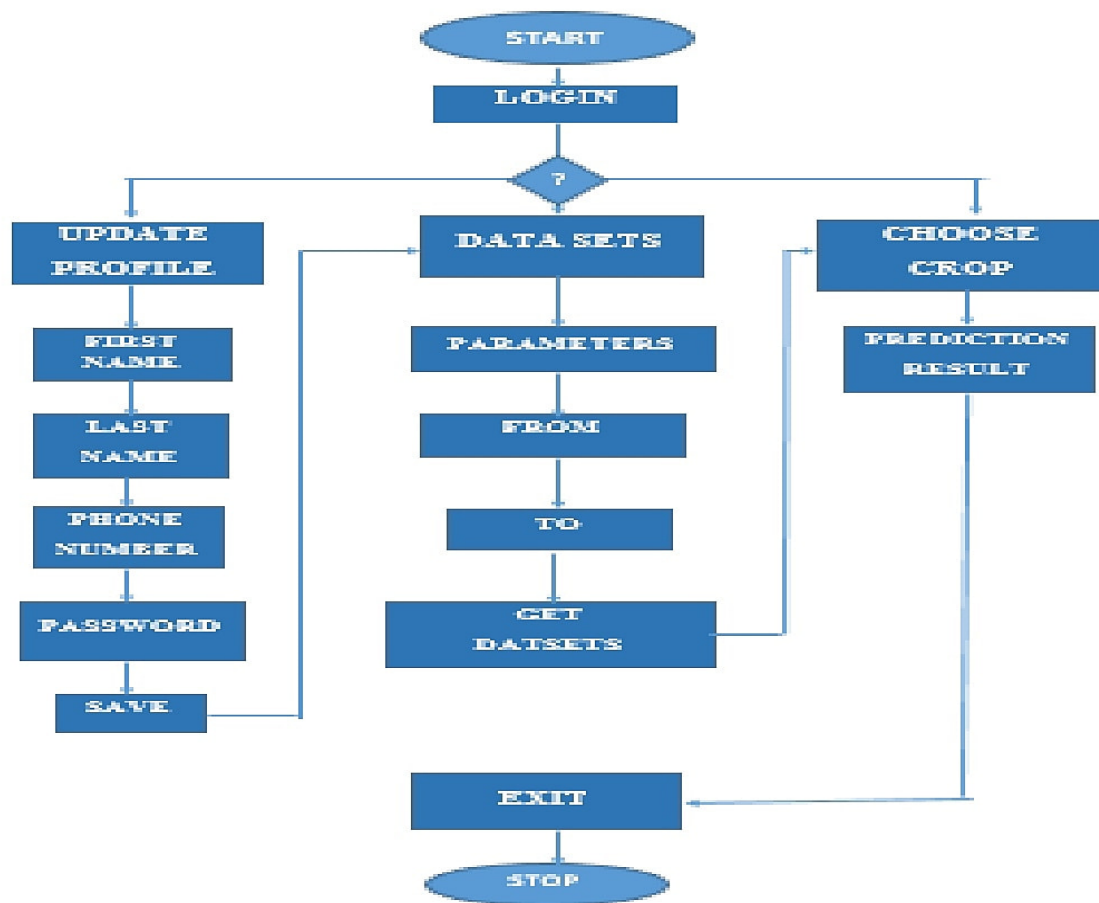

| NFR No | Non-Functional Requirement | Description |
|--------|----------------------------|--|
| NFR-1 | Usability | Contains easy user interface in order to use by uneducated people also |
| NFR-2 | Security | Information of the personal data are kept secure. By using data analytics, no loss or corruption of the data in dataset. The structure of the system is kept feasible enough so that there should not be any problem from the users' point of view |
| NFR-3 | Reliability | The best technique for rainfall is Simple RNN with a mean absolute error of 22.14 mm. After applying various techniques we found out that in Crop Yield and Crop Name . Random Forest yields the best result with minimum mean absolute error |
| NFR-4 | Performance | Performance analysis is done to find out whether the proposed system is time efficient and accurate. It is essential that the process of performance analysis and definition must be conducted in |

| | | |
|-------|--------------|---|
| | | parallel. The application's load time should not be more than one second for users. |
| NFR-5 | Availability | User can predict and estimate the crop yield throughout the period at any time. Platforms & tools used in this project are widely used. So the skilled manpower is readily available in the industry. |
| NFR-6 | Scalability | It can also work with an large dataset without performance degradation. All changes should be in positive direction, there will be increased level of efficiency and better customer service |

5. PROJECT DESIGN

5.1 Data Flow Diagram

A data flow diagram is a way of representing a flow of data through a process or a system. The data flow diagram also provides information about the outputs and inputs of each entity and the process itself.

(1) User (farmer) can login into project. User can also update their profile using First name, last name, phone number, password.

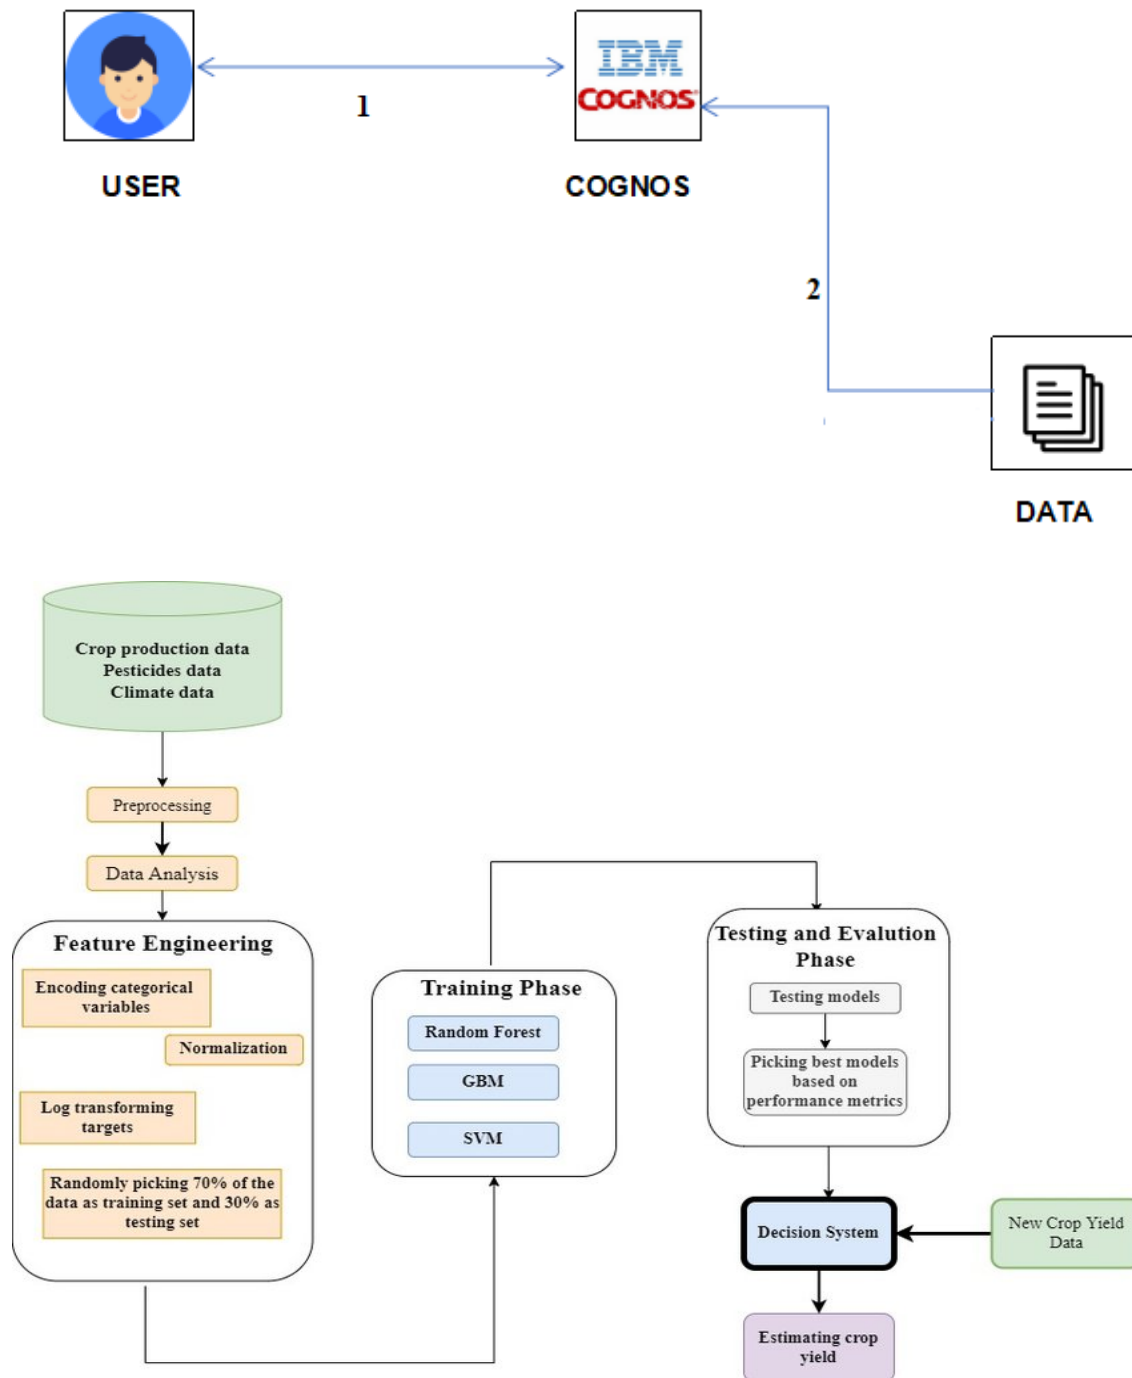

(2) User can enter the available dataset(rainfall, area, production etc).

(3) The project analyse the dataset and show the prediction in graphical Format.

(4) Then the user can use these prediction to increase the crop yield and reduce the crop loss.

(5) Then user can exit.

5.2 Solution & Technical Architecture

5.3 User Stories

| User Type | Functional Requirement (Epic) | User Story Number | User Story / Task | Acceptance criteria | Priority | Release |
|------------------------|-------------------------------|-------------------|---|---|----------|----------|
| Customer (Mobile user) | Registration | USN-1 | As a user, I can register for the application by entering my email, password, and confirming my password. | I can access my account / dashboard | High | sprint 1 |
| | | USN-2 | As a user, I will receive confirmation email once I have registered for the application | I can receive confirmation email & click confirm | High | sprint 1 |
| | | USN-3 | As a user, I will receive confirmation email once I have registered for the application | I can register & access the dashboard with Facebook Login | Low | sprint 1 |
| | | USN-4 | As a user, I can register for the application through Gmail | | Medium | sprint 1 |
| | Login | USN-5 | As a user, I can | | High | sprint 1 |

7. CODING AND SOLUTIONING

7.1 Feature 1

Login

A login page is a web page or an entry page to a website that requires user identification and authentication, regularly performed by entering a username and password combination.

Logins are used by websites, computer applications, and mobile apps. They are a security measure designed to prevent unauthorized access to confidential data. When a login fails (i.e, the username and password combination does not match a user account), the user is disallowed access.

Registration

The register module provides a conceptual framework for entering data on those patients in a way that: eases data entry & accuracy by matching the OpenMRS entry to the data source (usually paper files created at point of care), ties easily back to individual patient records to connect registers to patient data.

7.2 Feature 2

Data Visualization Chart

Data visualization charts are graphical representations of data that tell a story using symbols in order to improve the understanding of large amounts of data. Visual data metaphors such as charts effectively engage human perceptual processes and amplify human cognition more so than semantic data alone.

Production and Area for Crop_Year colored by Crop_Year

Area by State_Name colored by State_Name

Creating the dashboard

A data dashboard is a tool many businesses use to track, analyze, and display data—usually to gain insight into the overall wellbeing of an organization, department, or specific process.

Step 1: Import the necessary data into Excel. No data.

Step 2: Set up your workbook

Step 3: Add raw data to a table

Step 4: Data analysis

Step 5: Determine the visuals

Step 6: Create your Excel dashboard

Step 7: Customize your dashboard

8.2 User Acceptance Testing

Purpose of Document

The purpose of this document is to briefly explain the test coverage and open issues of the crop yield estimation through data analytics project at the time of the release to user acceptance testing(UAT).

Defect Analysis

This report shows the number of resolved or closed bugs at each severity level, and how they were resolved

| Resolution | Severity 1 | Severity 2 | Severity 3 | Severity 4 | Subtotal |
|-------------------|------------|------------|------------|------------|----------|
| By Design | 7 | 5 | 3 | 2 | 17 |
| Duplicate | 1 | 0 | 2 | 0 | 3 |
| External | 3 | 2 | 0 | 1 | 6 |
| Fixed | 11 | 3 | 5 | 15 | 34 |
| Not Reproduced | 0 | 0 | 0 | 1 | 1 |
| Skipped | 0 | 1 | 0 | 1 | 2 |
| Won't Fix | 0 | 3 | 5 | 1 | 9 |
| Totals | 22 | 14 | 15 | 21 | 72 |

Test Case Analysis

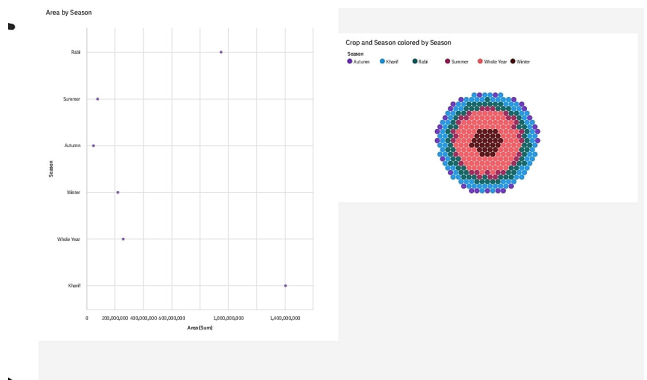

This report shows the number of test cases that have passed, failed, and untested.

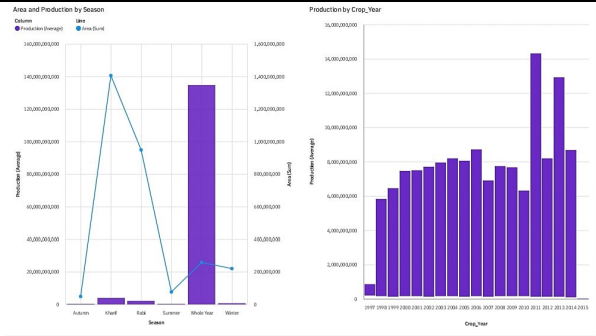

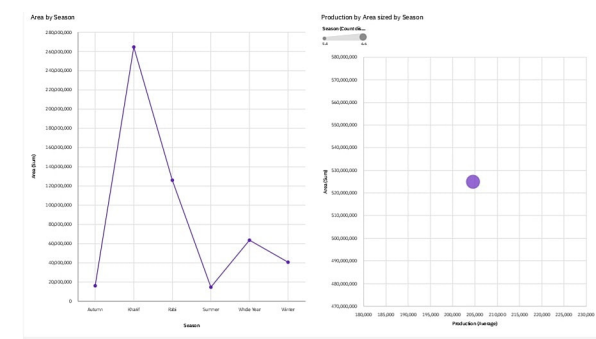

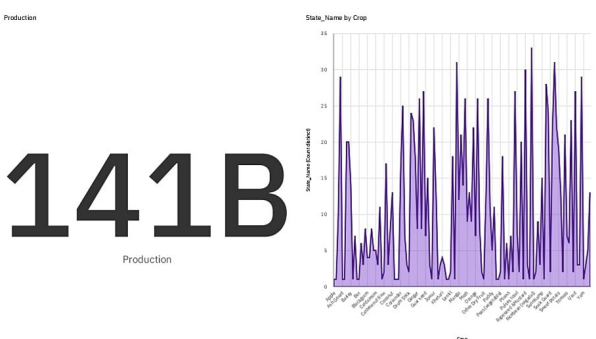

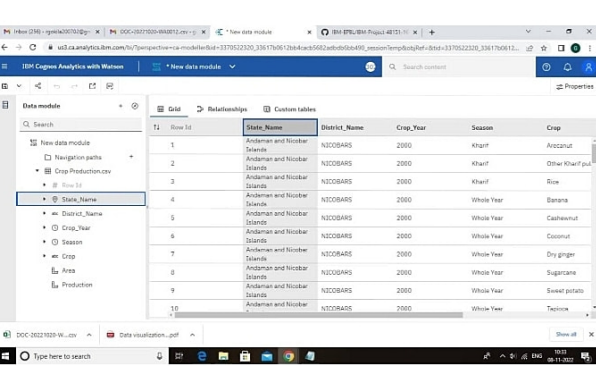

| Section | Total Cases | Not Tested | Fail | Pass |
|--------------|-------------|------------|------|------|
| Print Engine | 6 | 0 | 0 | 6 |

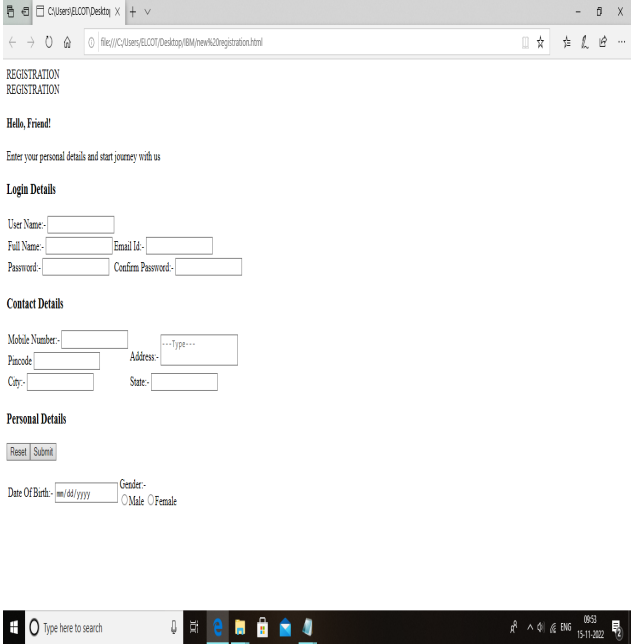

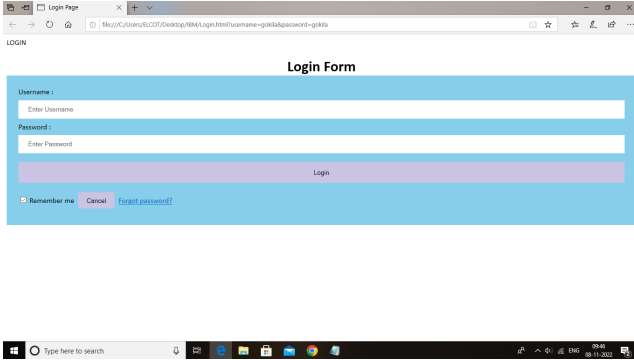

| | | | | |
|---------------------|----|---|---|----|
| Client Application | 40 | 0 | 0 | 40 |
| Security | 2 | 0 | 0 | 2 |
| Outsource shipping | 3 | 1 | 1 | 2 |
| Exception Reporting | 9 | 7 | 0 | 9 |
| Final Report Output | 4 | 0 | 0 | 4 |
| Version Control | 2 | 0 | 0 | 2 |

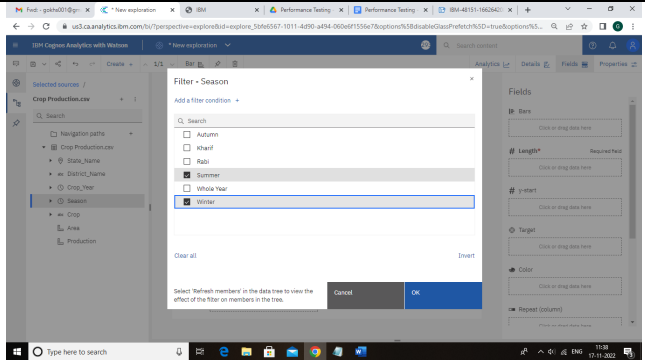

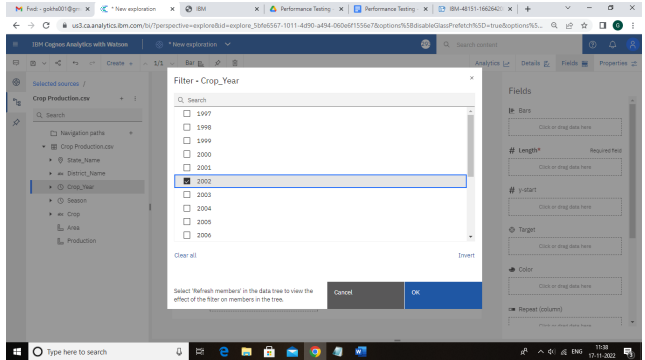

9. RESULTS

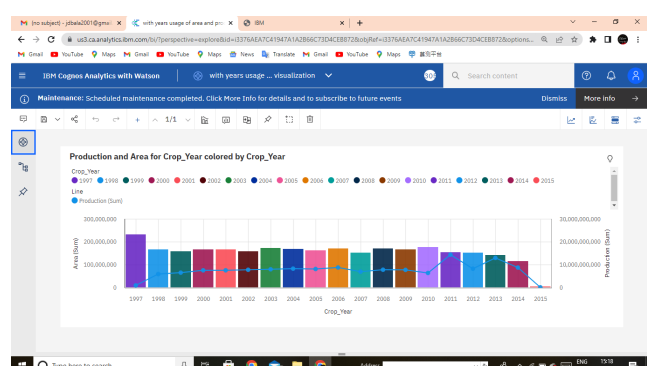

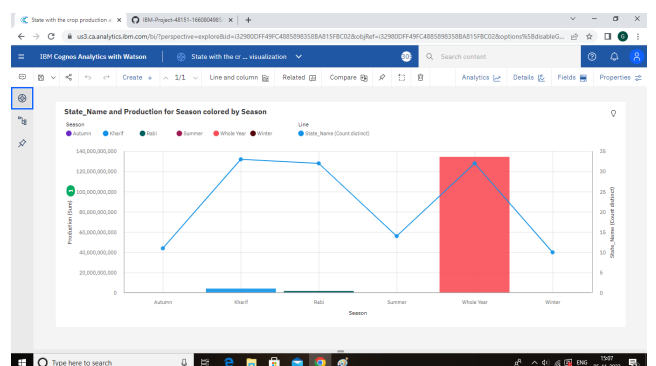

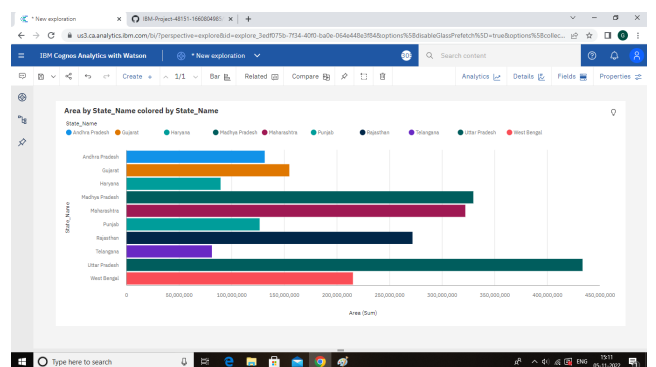

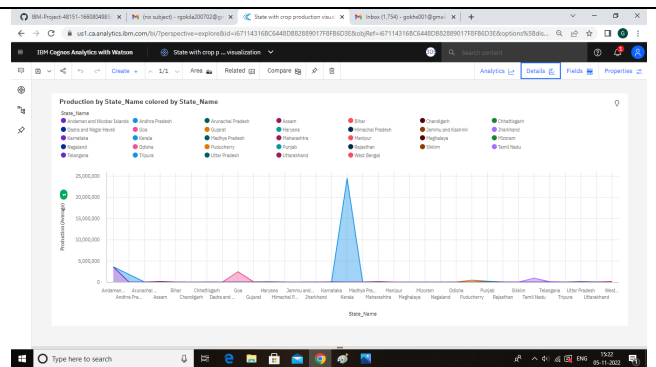

9.1 Performance Metrics

| S.No | Parameter | Screenshots / values |
|------|------------------|---|
| 1 | Dashboard design | <p>No of visualization / Graphs - 10</p>  |

| | | |
|---|---------------------|--|
| | |  |
| | |  |
| | |  |
| 2 | Data Responsiveness |  |

| | | |
|---|-----------------------------|--|
| 3 | Amount Data to Rendered |   |
| 4 | Utilization of Data Filters |  |

| | | |
|---|----------------------|--|
| | |  |
| | |  |
| 5 | Effective User Story | No of Scene Added - 5 |
| 6 | Descriptive Reports | No of Visualization / Graphs - 5 |

10. ADVANTAGES & DISADVANTAGES

Advantages

- Helps in the interpretation of data pattern that assist decision-making and performance improvement.
- Helps in analysing some important visualization, creating a dashboard and by going through these we will get most of the insights of crop production.
- Helps to make the decision about when to plant and harvest crops based of rainfall, season, area.
- This will reduce the waste generated and improve the profit of the farmer in a digitalized way.

Disadvantages

Some uneducated farmers cannot able to use this applicaton.

11. CONCLUSION

As a result of penetration of technology into agriculture field, there is a marginal improvement in the productivity. The innovations have led to new concepts like digital agriculture, smart farming, precision agriculture etc. The activities of agriculture field are numerous like weather forecasting, soil quality assessment, seeds selection, crop yield prediction etc. In this project, the specific activity, crop yield estimation has been surveyed and the major trends have been identified.

It can be concluded that the research in the field of agriculture with reference to using IT trends like data analytics is in its infancy. As the food is the basic need of humans, the requirement of getting the maximum yields using optimal resource will become the necessity in near future as a result of growing population.

Based on our analysis, model will be more accurate if the more datasets are available. So as the data point increases our system will become more and more accurate. Our system accuracy is more than the existing system. Since we are displaying the results in the form of graph with actual and predicted in the graphical user interface it is easy to compare the previous year's data. This model will help farmers to grow the crop which will give more yield so that it will be more profitable.

12. FUTURE SCOPE

In future, this model can be implemented throughout the India by adding the data points for all the region. According to our analysis model will give more accuracy as the data points increases, so to get better accuracy model data points can be increased. Our system can be integrated with messaging module so that registered farmers can get the notification of the prediction directly to their registered mobile numbers.

This project solves one of the fundamental problems that the Indian farmers are facing that is selection of which type of crop will yield the maximum results. The sole objective is to increase farmer's income. Lack of proper dataset is the major hurdle while predicting the name of the crops but we were able to manage that by merging different data sets. This project right now covers only five features that are season ,area ,temperature, rainfall and crop name but that's not the end, this project holds numerous possibilities such as the addition of vapour pressure, soil quality and market integration.

This project if compiled with a bigger data set can be a boon for the government as it may help them plan properly and in turn help our objective.
